

# **A BETTER UNDERSTANDING OF THE MORPHOLOGY AND THE STRUCTURE OF THE PLASTICS VERSUS THE TEMPERATURE, CONDUCTIVE TO CORRECT RADON MEASUREMENTS AND TO ADVANCED RADON MONITORS**

**L. Tommasino<sup>1</sup> and D. Pressyanov<sup>2</sup>**

**<sup>1</sup>National Agency for Environmental Protection (Retired)**

**•Via Cassia 1727, Roma, Italy**

**<sup>2</sup> Faculty of Physics – Sofia University “St. Kliment Ohridski”, Sofia,  
Bulgaria**

I just want to say one word to you. Just one word. Plastics.

**INSTEAD OF D. HOFFMAN, IT WAS THE GRADUATE  
L. TOMMASINO, WHO WORKED SINCE 1967 ON PLASTICS,  
FOR:**

- The neutron- and Rn-dosimetry**
- The development of the permeation Rn monitors**
- The development of the film-badge Rn monitors**

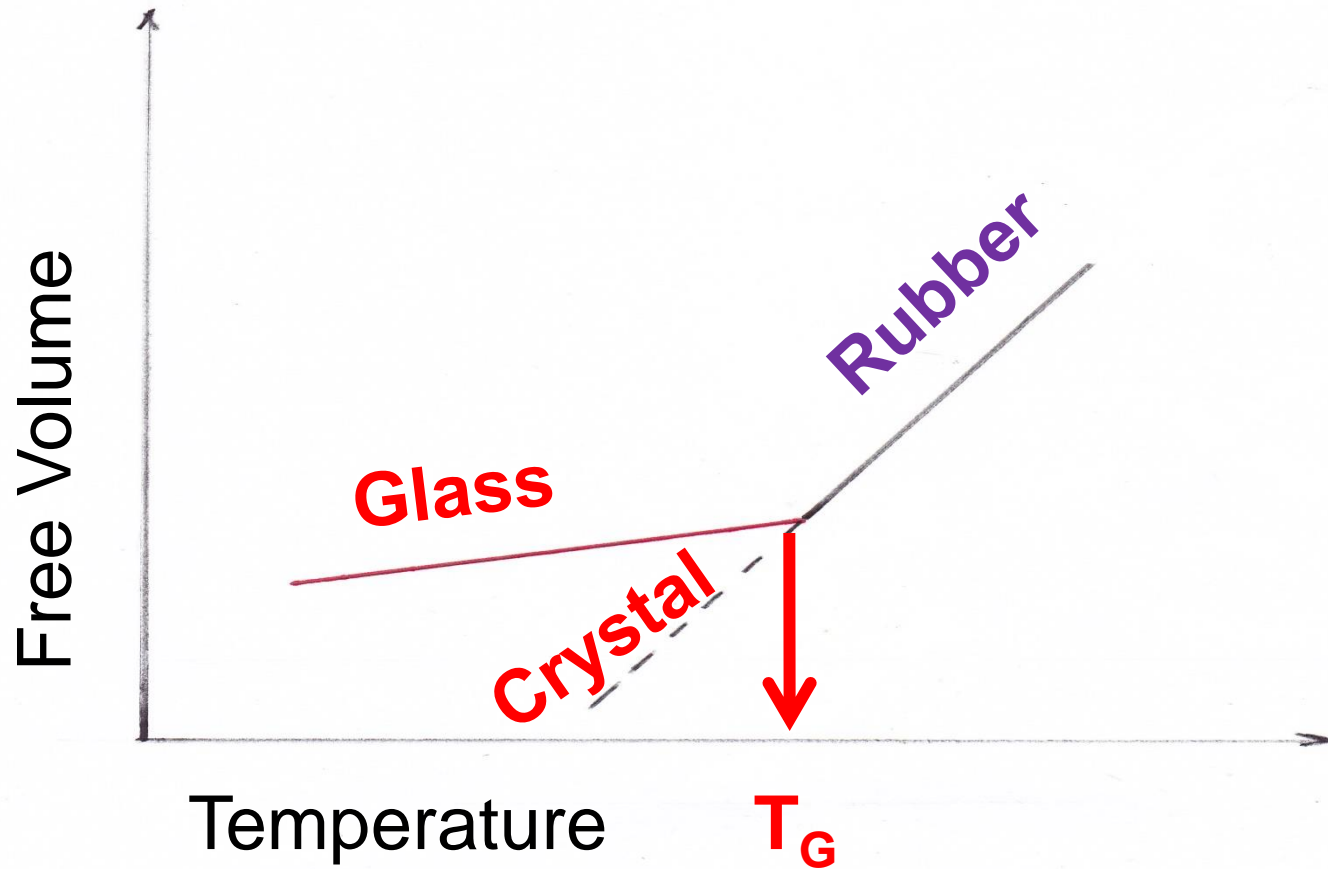

**FROM GLASS TO RUBBER AT  $T_G = \sim 600\text{ }^{\circ}\text{C}$**

**Plastics very successful for their small  $T_g$**

# GLASS/PLASTIC SIMILARITIES

$T_G$ : Transition temperature from Rubber to Glass

# PLASTICS VS SODA-LIME GLASS

## GLASS-LIKE

Soda-lime Glass

$T_G$

~ + 600 °C

Polyethylene Terephthalate

~ + 70 °C

Polycarbonate

~ + 150 °C

## RUBBER-LIKE

Polyethylene

$T_G$

~ - 80 °C

Rubber

~ - 70 °C

GO BEYOND PLASTIC

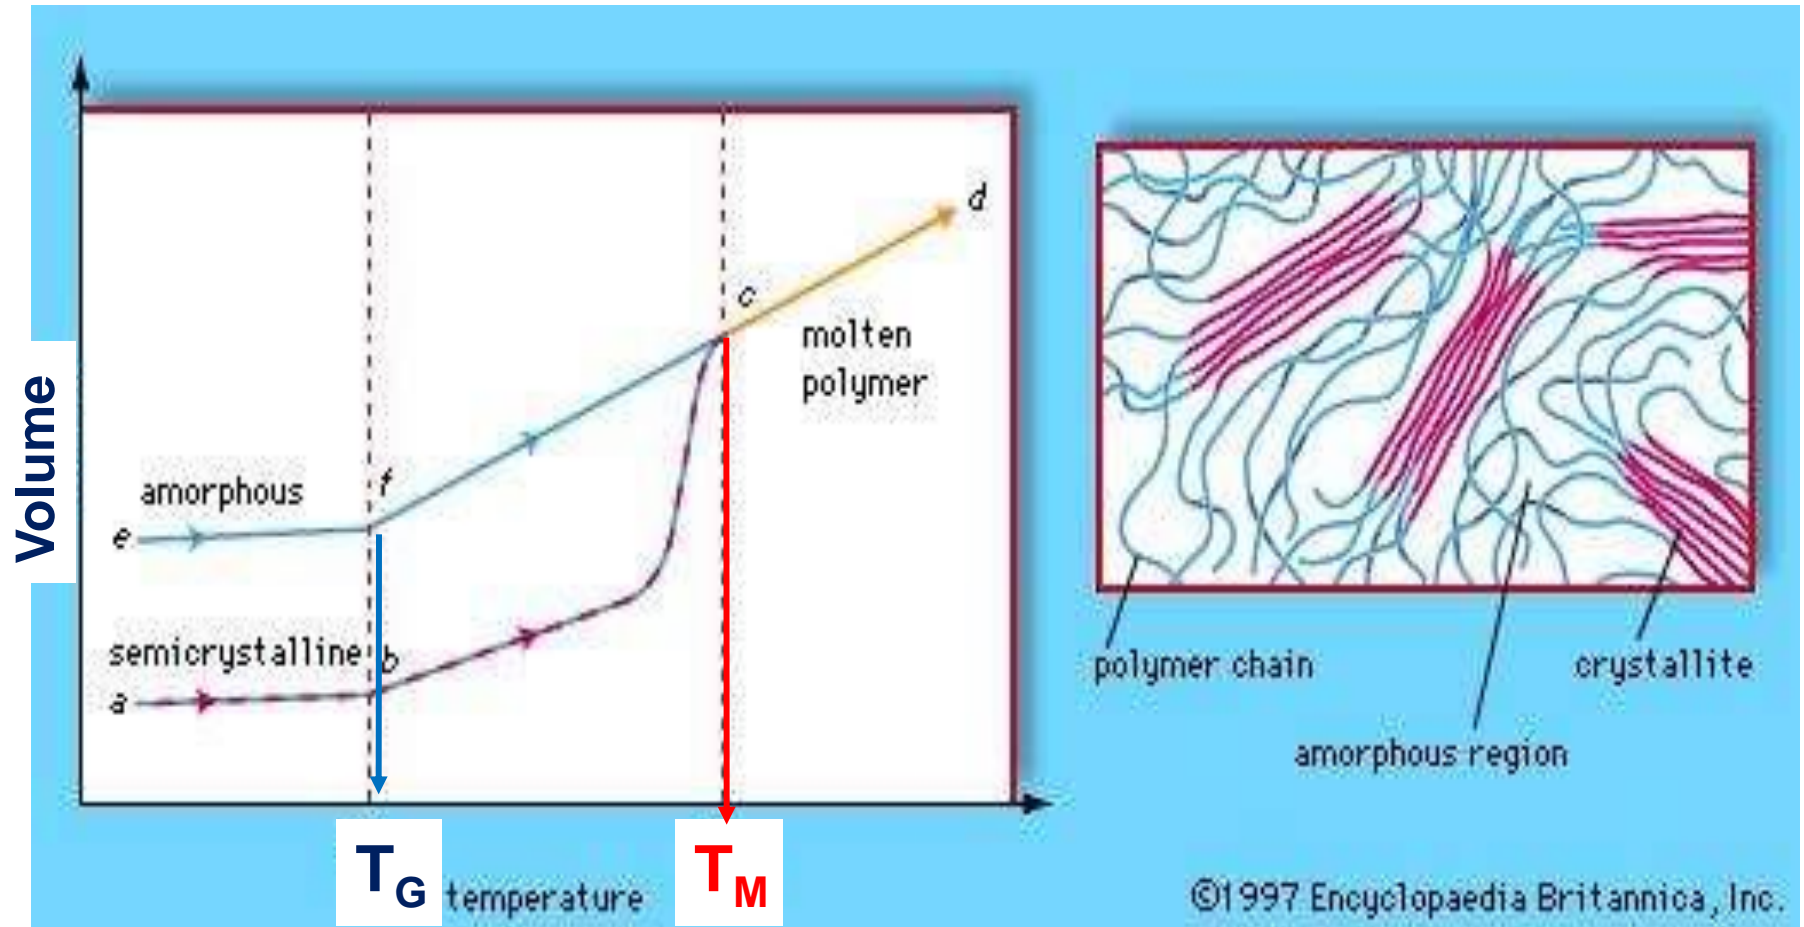

Discover more at [northsails.com](http://northsails.com)

**Unfortunately, plastics have been too successful !**

# THERMOPLASTICS:

Amorphous (low-density);  $T_G$   
Crystalline (high-density);  $T_M$

**AMORPHOUS**(Low density)

**Glass to rubber at  $T_G$**

*RANDOM COILS*

*Like “cooked spaghetti”*

**CRYSTALLINE** (High density)

**Crystal to liquid at  $T_M$**

*SEMICRYSTALLINE POLYMERS*

*A bit like "uncooked spaghetti ”*

**Amorphous Polymers with Plasticizers**

<b>THERMOPLASTICS:</b> <b>Amorphous, Crystalline</b>	<b>T<sub>G</sub></b>	<b>T<sub>M</sub></b>
<b>POLYETHYLENE-Low-density</b> <b>Amorphous</b>	-80	
<b>POLYETHYLENE-High-density</b> <b>Crystalline</b>		<b>+ 140</b>
<b>POLYCARBONATE-Makrofol N</b> <b>Amorphous</b>	<b>+ 150</b>	
<b>POLYCARBONATE- Makrofol DE</b> <b>Crystalline</b>		<b>+220</b>
<b>POLYETHYLENE-THEREPHTHALATE</b> <b>Amorphous</b>	<b>+ 70</b>	
<b>POLYETHYLENE-THEREPHTHALATE</b> <b>Crystalline</b>		<b>+270</b>

# **THERMOPLASTICS**

- Amorphous Polymers with  $T_G$
- Crystalline Polymers with  $T_M$

# **THERMOSETS**

Cross-linked Polymers; High density;  
No critical temperature; They just  
decompose or burn at high temperatures

## F. F. TRACKS IN POLYTHYLENE TEREPTHALATE

Crystalline

Amorphous

Different sensitivities ( $V_T / V_B$ ) since  
 $V_B \text{ crystalline} \ll V_B \text{ amorphous}$

# TRACK DETECTORS BY THERMOPLASTICS

- AMORPHOUS PLASTICS (Poor detector)
- CRISTALLINE PLASTICS (Good detector)

## TRACK DETECTORS BY THERMOSETS-

- highly cross-linked (e.g. CR-39) with unique thermal stability (Excellent Detector)

## **CR-39 TRACK-DETECTION CHARACTERISTICS:**

- High Radiation sensitivity**
- High optical clarity and uniformity**
- Extremely tight molecular structure**
  - High thermal stability**

**Consumer products, made of crystalline Polycarbonate and CR-39, useful for retrospective dosimetry**

**A track hole on the crystalline PC-mask of the Apollo8 astronaut (Courtesy of R. L. Fleischer)**

**CDs and bottles, made of crystalline polycarbonate. respectively for retrospective Radon- and Neutron-dosimetry**

**Existing Rn-monitors ,  
mission-oriented towards  
measurements in homes  
(20-25 °C and R.H.  $\leq$  50)**

# Calibrations and intercomparisons aimed at Rn-measurements in homes

Courtesy from J. Miles

**WITH THE HOME MONITORS,**  
**a variety of errors may occur if used in**  
**workplaces or any place with severe**  
**environmental conditions**  
**(0÷40 °C, up to 100 R.H.)**

**Most monitors based on diffusive chambers,**  
**with the only requirements of a height  $\leq 2.5$  cm and**  
**conductive walls (Frank and Benton, 1977)**

# Problems of humidity for in-air diffusion-chambers first used in soil

# ***Response ratio [Thoron]/[Radon]***

**82%**

(Tokonami et al., 2001)

**67%**

(Tokonami et al., 2001)

**3%**

(Tokonami, 2005)

# Most hidden errors for water-filled Rn-entry ports

**Rn-Diffusion through the interface-air,  $T \geq 10$  min.**  
**Rn-permeation through water,  $T \geq 10000$  hours**

# **PERMEATION SAMPLING BY LOW-DENSITY (RUBBER-LIKE) POLIETHYLENE**

**Permeability to Radon three orders of magnitude larger than that to water vapor**

**+  
fast thermodynamic equilibrium of the Rn at  
the rubbery interface (Henri's Law)**

Permeation samples to stop water vapor, thoron, etc....but a long permeation time,  $T_M$

$$T_M = dV/PS$$

$T_M = 34$  hours

$T_M = 6$  hours

$T_M = 33$  hours

$$T_M = dV/PA$$

**AREA II = AREA III, provided constant P**  
**-Very wrong! P changes with temperature**

**Temperature-T  
(°C)**

**PE-Permeability-P  
( $10^{-7}\text{cm}^2/\text{s}$ )**

**0 °C**

**$0.15 \pm 0.04$**

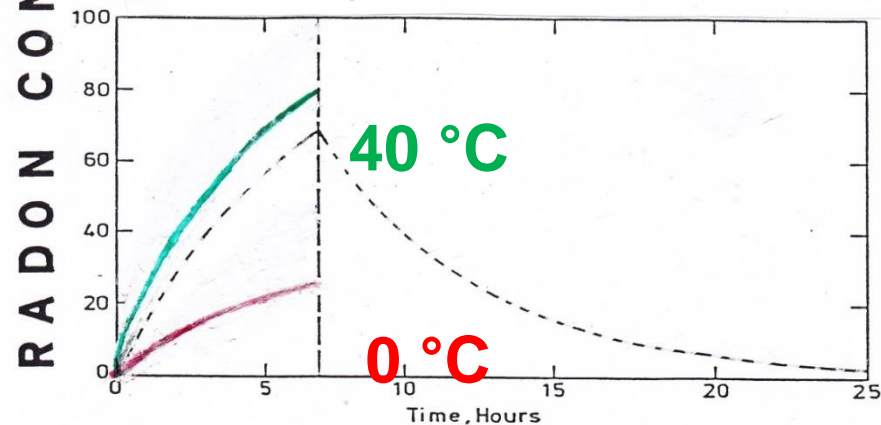

**20 °C**

**$1.20 \pm 0.04$**

**40 °C**

**$3.60 \pm 0.50$**

Permeation time,  $T_M = dV/PA$

TIME

Responses at 0 °C, 20 °C, 40 °C with  $T_M = 34$  h

$$T_M = dV/PA$$

$T_M = 34$  hours

$T_M = 6$  hours

33 hours

Temp.  
0°C  
40°C

$C_{in}/C_o$   
**0.32**  
**0.92**

$C_{in}/C_o$   
**0.73**  
**0.99**

$C_{in}/C_o$   
**0.33**  
**0.92**

$$T_M \leq 1 \text{ hour} \quad t_0 = 8 \text{ hours}$$

For an exposure of 8 working hours ,  
 $T_M \leq 1 \text{ hour}$  as in diffusive chambers

For existing permeation monitors,  
 $T_M$  (dV/PA)  $\leq 1$  hour only for small  
air volumes (but too small responses)

$T_M \leq 1$  hour and any desired response  
by Rn-sorption-based radiators

# **GAS (RADON) SORPTION IN SOLIDS**

**(Mc Bain, 1909)**

## **1. ABSORPTION:**

**Gas-sorption into the solid bulk**

## **2. ADSORPTION:**

**Gas-sorption onto the solid surface**

**Absorber**

**Solubility, S**

**Liquid Scintillators**

**~ 10**

**Polycarbonate**

**~ 100**

**CR-39**

**~ 1**

# First Rn-film badge made of AMORPHOUS POLYCARBONATE (Radiator) CR-39 (Detector)

**Time to equilibrium:  $T=d^2/6D$**

**MEDIUM**

**$D(\text{cm}^2/\text{s})$**

**Air**

**$\sim 10^{-1}$**

**Polycarbonate**

**$\sim 10^{-10}$**

**CD equilibrium-time  $\sim 1$  month**

# FAST EQUILIBRIUM TIME by a small film thickness, $d$

20- $\mu\text{m}$ -polycarbonate:  $T \leq 3$  hours

5- $\mu\text{m}$ -polycarbonate:  $T \leq 10$  minutes

$$T_{\text{Abs}} = (d^2/6D)$$

Small  $d$ : fast and no temperature-dependent response

The stack absorption-time,  $T_{\text{abs}}$ , is that of a single film

$$\epsilon_{\text{max}} = KCS R_{\text{max}}$$

For  $d \leq R_{\text{max}}$ , different responses for different  $d$

$\epsilon_{\max} = KCSR_{\max}$ ; Not valid for large air-space radiators,  
i.e. with airspace with **height > 2.5 cm**

Detector

**Diffusive chambers for Rn monitoring  
must have heights  $\leq 2.5$  cm  
(Frank and Benton, 1981)**

**For heights  $\leq 0.5$  cm the Rn absorption  
by the plastic holder is dominant.**

**R (Tracks.m<sup>3</sup>/cm<sup>2</sup>.kBq.h)**

**R = 0.80 ± 0.10**

**R = 0.64 ± 0.12**

**$R_1 = 0.80 \pm 0.10$**   
 **$R_2 = 0.10 \pm 0.01$**   
 **$R_3 = 0.010 \pm 0.002$**

**All-encompassing Rn Monitor, used indoors, in soil, in water.**

- Easily wearable and deliverable
- Enclosable in any (x-,  $\gamma$ -, n-) *personnel-dosimetry holder*
- The holder of choice: a heat sealed Tyvek Bag*

**FROM:  $R = k \cdot C \cdot S$  (Solubility)  $\cdot d$  (Thickness):**

- Badges with any desired response

**Or alternatively:**

-a new method to evaluate **Solubility,  $S$**

Large S and Large D by amorphous plastics	S	D (cm <sup>2</sup> /s)
POLYETHYLENE- Rubbery Low-density (Amorphous)	~ 4	~10 <sup>-7</sup>
POLYCARBONATE Low density (Amorphous)	~ 100	~10 <sup>-10</sup>
POLYETHYLENE-THEREPHTHALATE Low density (Amorphous)	~ 10	~10 <sup>-9</sup>

**The largest Permeability,  $P = S \cdot D$ , with rubbery polyethylene**

Radon absorption per unit surface,

$$Q_{Rn} = (D/\lambda)^{1/2} \cdot S \cdot C$$

-Large  $Q_{Rn}$  for amorphous polymers

-Low  $Q_{Rn}$  for crystalline polymers

S

D  
(cm<sup>2</sup>/s)
